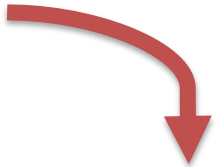
Systems Biology
Approaches in
Cancer Research

- First Principles: Genetics & Reductionism
- Cancer is More than "Just Genetics"
- Examples of the use of Big Data in Systems Biology Approaches

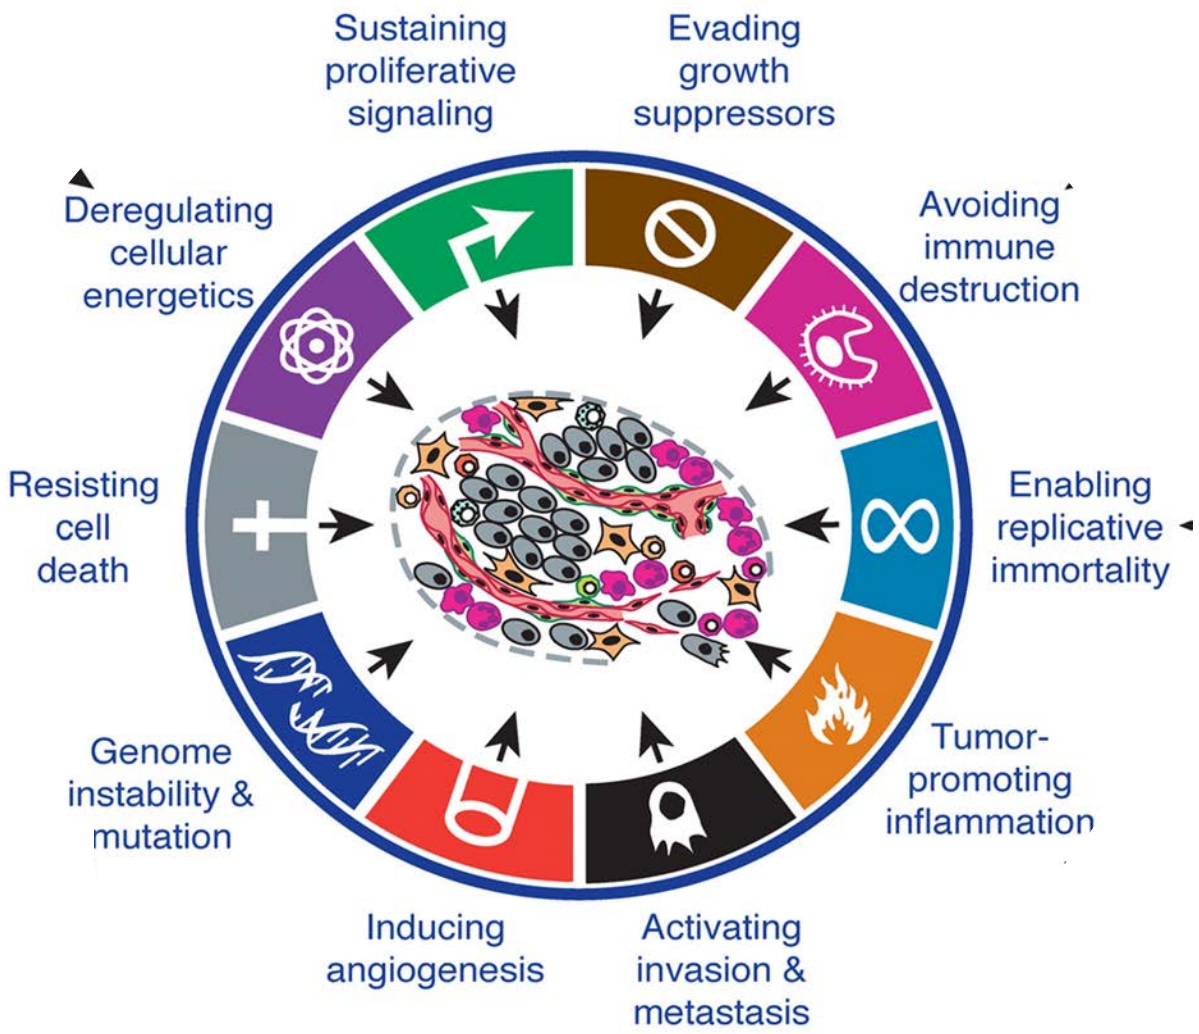
First Principles

- Cancer is a genetic disorder caused by genetic alterations to DNA
- Most mutations are acquired, some are inherited



Accumulation of mutations leads to the hallmarks of cancer
(Hanahan and Weinberg, 2011).

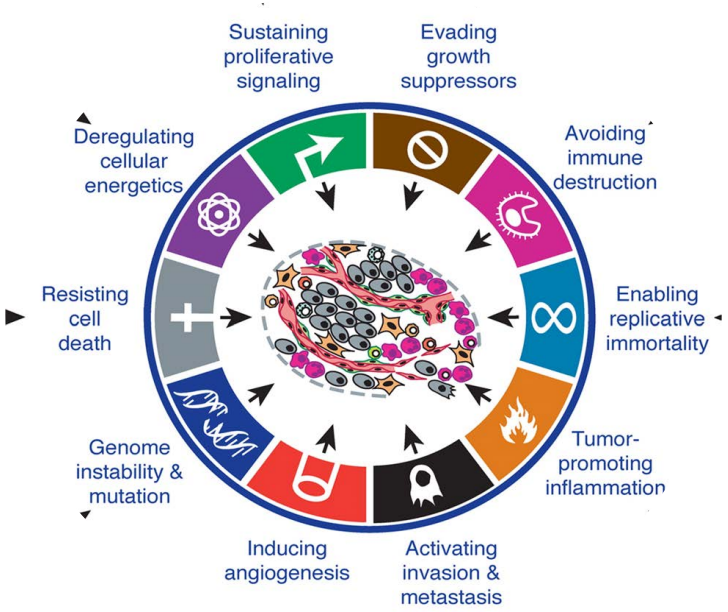
Hallmarks of Cancer



Hanahan & Weinberg. 2011. Cell.

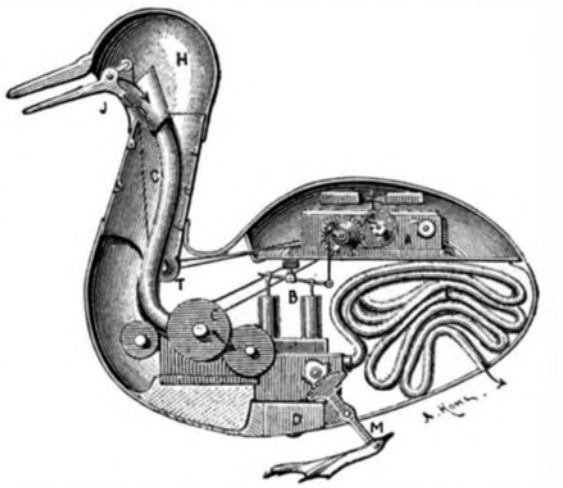
as of July 2024: 76,104 citations

“Traditional View: Cancer is a disease of uncontrolled growth due to genetic mutations”

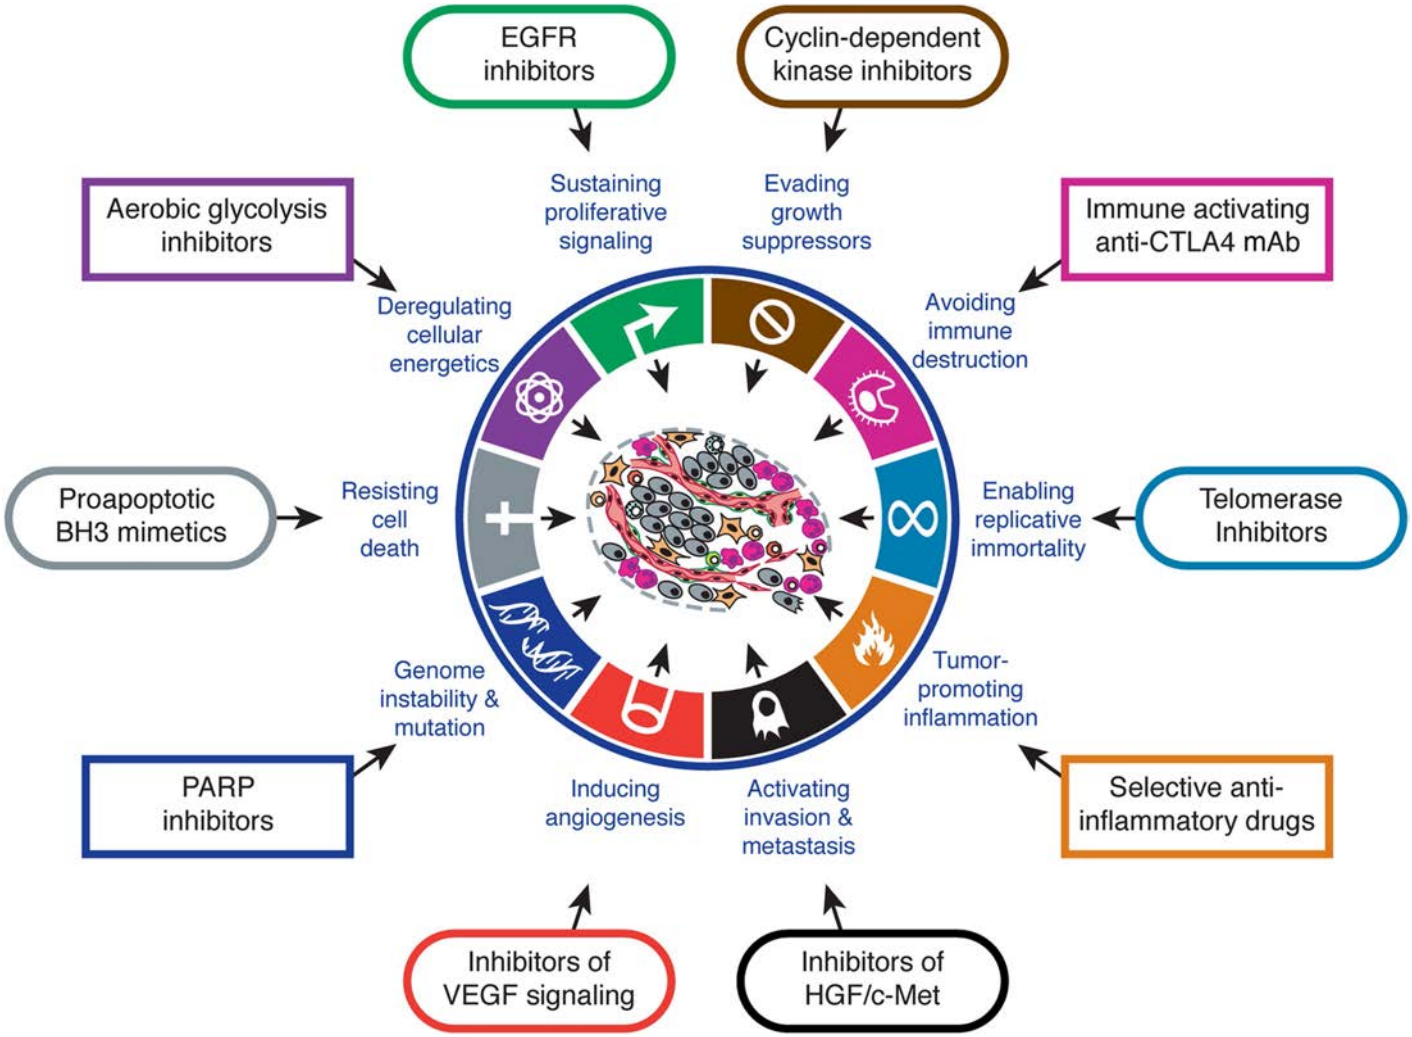


Reductionism: the predominant research paradigm

- Much like a mechanic who repairs a broken car by locating the broken part, a reductionist approach to understanding cancer aims to identify an isolatable abnormality and then develop a treatment to target that abnormality. Implicit within this approach is the motivation and approach that cancers have potential singular target(s).



Targeting Cancer



Hanahan & Weinberg. 2011. Cell.

as of May 2022: 60,017 citations

The Limits of Reductionism

- Low rate of clinical trial success

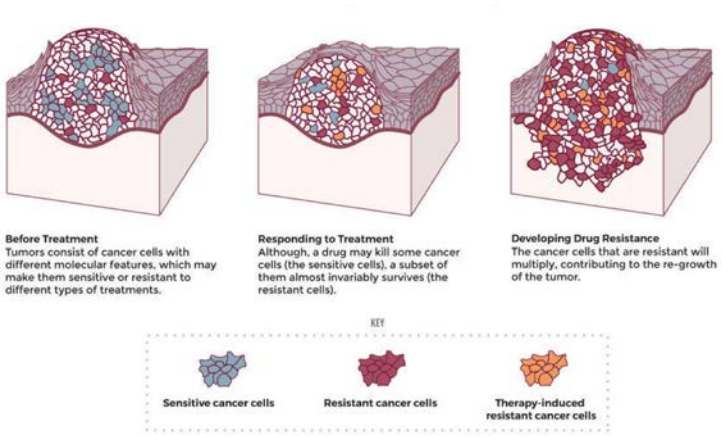
  "Cancer therapeutics currently have the lowest clinical trial success rate of all major diseases.… Partly as a result of the paucity of successful anti-cancer drugs, cancer will soon be the leading cause of mortality in developed countries.

EDITORIAL

Rethinking cancer: current challenges and opportunities in cancer research

Ross Cagan, Pablo Meyer

Disease Models & Mechanisms 2017 10: 349-352; doi: 10.1242/dmm.030007



cancer.gov

- Development of Drug Resistance

  "… nearly all current treatments face the same problem: for many patients, they ultimately stop working. Commonly known as drug resistance, this phenomenon is one of the most challenging problems facing cancer researchers and patients today."

"I think the next frontier in precision genomic medicine is figuring out how to circumvent resistance"
-- Laurie Glimcher, M.D., President, Dana-Farber/Harvard Cancer Center

The Limits of Reductionism

Cancer is More than "Just Genetics"

The traditional view of cancer emphasizes a genes-first process for initiation and tumorigenic development.

Recent studies however, point to "System Breakdown"…

Genetic Mutations are Not Sufficient for Cancer

Benign conditions with oncogenic driver mutations

From: The paradox of cancer genes in non-malignant conditions: implications for precision medicine

Gene	Type of alteration	Benign or premalignant condition	Frequency of alteration in benign condition (%)	Examples of drug(s) that can potentially target the alteration	Examples of malignancies associated with this gene alteration	Mechanism
BRAF	V600E, D594V, V599E	Melanocytic nevi	70–88% [3,4,5,6,7,8,9,10,11,12]	BRAF and/or MEK inhibitors such as dabrafenib and trametanib [13, 14]	Melanoma	RAS-RAF-MEK-ERK pathway upregulation [15]
NRAS	Q61K	Giant congenital melanocytic nevi	6–14% [10, 11]	MEK inhibitors [12] such as trametinib [16]	Melanoma	RAS-RAF-MEK-ERK pathway upregulation [15]
	Q61K and Q61R	Melanocytic nevi	70–95% [17, 18]	MEK inhibitors such as trametinib [16]	Melanoma	RAS-RAF-MEK-ERK pathway upregulation [15]
FGFR3	R248C, S249C, G372C, S373C, A393E, K652E, K652M	Seborrheic keratosis	~18–85% [19,20,21,22]	FGFR inhibitors such as erdafitinib [23]	Urothelial carcinoma	Activation of the FGF/FGFR machinery [24]
	R248C, G372C, G382R	Epidermal nevi	33% [25]	FGFR inhibitors such as erdafitinib [23]	Urothelial carcinoma	Activation of the FGF/FGFR machinery [24]
PIK3CA	E542K, E545K, H1047R	Seborrheic keratosis	~16% [20]	PIK3CA inhibitors such as alpelisib [26]	Breast cancer	PI3K-AKT-mTOR pathway activation
	M1043V	Endometriosis	~4% [27]	PIK3CA inhibitors such as alpelisib [26]	Breast cancer	PI3K-AKT-mTOR pathway activation
	H1047L, H1047R	Normal esophagus mucosa	Not listed [28]	PIK3CA inhibitors such as alpelisib [26]	Breast cancer	PI3K-AKT-mTOR pathway activation
ALK	TPM3-ALK, TPM4-ALK	Inflammatory myofibroblastic tumor	~50% [29]	ALK inhibitors [30] such as alectinib [31]	Non-small cell lung cancer	ALK pathway activation [32]
NOTCH1	Loci not specified	Aging esophagus	12–80% [33]	No specific inhibitors approved	Colon cancer	Wnt-beta-catenin pathway activation [34]
KRAS	G12V or G12D	Arteriovenous malformations in brain	~63% [35, 36]	MEK inhibitors such as trametinib [16]	Colorectal and pancreatic cancer	RAS-RAF-MEK-ERK pathway upregulation [15]
	G12C, G12V, G12A, G12D, G12R	Endometriosis	~21% [27]	MEK inhibitors such as trametinib [16]	Colorectal and pancreatic cancer	RAS-RAF-MEK-ERK pathway upregulation [15]
	Q61R	Normal testis	Not listed [28]	MEK inhibitors such as trametinib [16]	Colorectal and pancreatic cancer	RAS-RAF-MEK-ERK pathway upregulation [15]
TP53	R177S, Q192L, R196*, K139R, H193Y, E224fs, N239S	Rheumatoid arthritis synovium	17–46% [37, 38]	Bevacizumab may target angiogenesis upregulation that results from *TP53* mutations [39]	Serous ovarian cancer (*TP53* mutations are common across cancers)	*TP53* is a tumor suppressor gene [40]
	Loci not specified	Aging esophagus	2–37% [33]	Bevacizumab may target angiogenesis upregulation that results from *TP53* mutations [39]	Serous ovarian cancer (*TP53* mutations are common across cancers)	*TP53* is a tumor suppressor gene [40]
CTNNB1	T41A and S45P	Desmoid tumor	88% [41]	COX-2 inhibitors [42] such as celecoxib [43], as well as sorafenib (which can suppress CTNNB1-mediated activation of the WNT pathway) [13, 14, 44]	Adrenocortical cancers	Wnt-beta-catenin pathway activation [45]
FGFR2	Y376C, P286S	Keratinocytic epidermal nevus	5–10% [46]	FGFR inhibitors such as erdafitinib [23]	Urothelial carcinoma	FGF/FGFR machinery [24]
AKT, *MAPK*, and *AMPK* pathway genes	–	Alzheimer's disease	~27% [47]	mTOR inhibitors or MEK inhibitors	Multiple tumor types	Increases tau phosphorylation

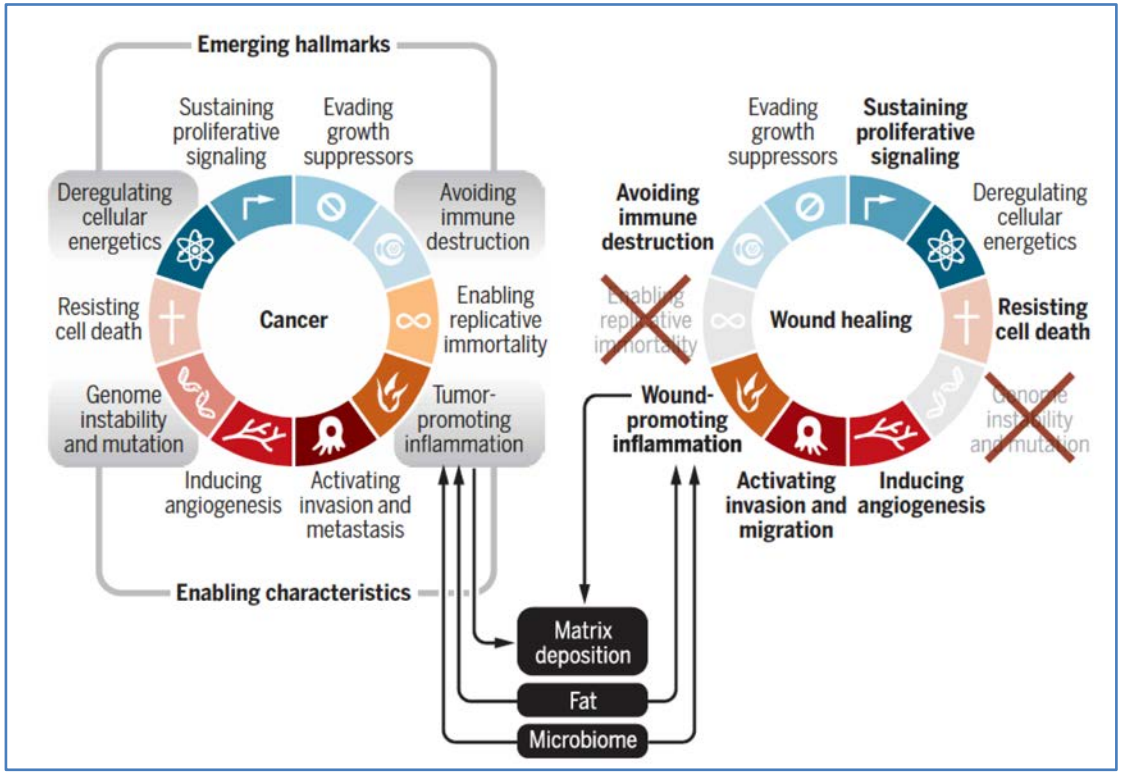
Rethinking cancer: current challenges and opportunities in cancer research

Ross Cagan, Pablo Meyer

Disease Models & Mechanisms 2017 10: 349-352; doi: 10.1242/dmm.030007

"…cancer is not just a disease of mutated genes but of dysfunctional pathways that no longer limit growth"



MacCarthy-Morrogh and Martin, *Sci. Signal.* **13**, eaay8690 (2020) 8 September 2020

Guiding Principles for Cancer Systems Biology …

Tumors inherit control strategies present in their tissue of origin

Both normal and tumor cells participate in communities

Dividing line between normal and cancer cells is not sharp

To escape control, tumor cells must work within the system

Cancer Biology Needs…

Technologies that embrace complexity (i.e. **Big Data** Generators)

Technologies that preserve spatial structures and relationships

Approaches that provide quantitative information

Modeling approaches & analysis pipelines

e.g. Models that predict emergent properties of a system

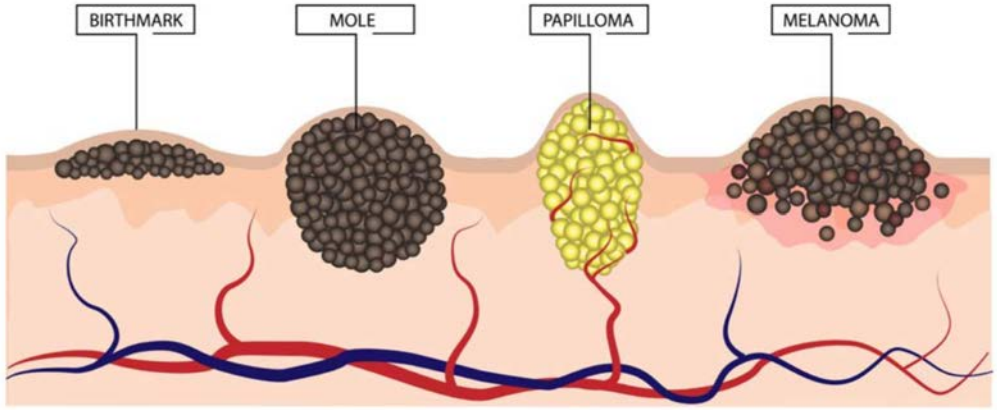
Nevi/Melanoma

Research Article
Cancer Biology, Computational and Systems Biology

Dynamics of nevus development implicate cell cooperation in the growth arrest of transformed melanocytes

Rolando Ruiz-Vega, Chi-Fen Chen, Emaad Razzak, Priya Vasudeva, Tatiana B Krasieva, Jessica Shiu, Michael G Caldwell, Huaming Yan, John Lowengrub, Anand K Ganesan, Arthur D Lander « see less

Nevi/Melanoma

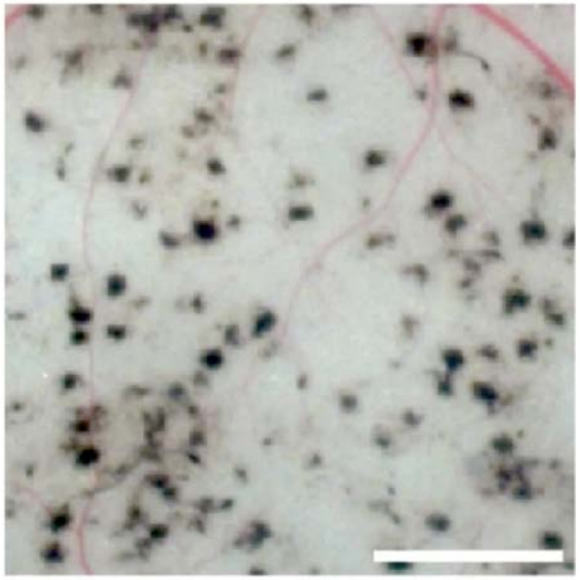


70%-90% of all nevi have $Braf^{mut}$ melanocytes
~50% of melanomas have $Braf^{mut}$

The lifetime risk for a mole in a 20 year old developing into melanoma by age 80 years is approximately 0.03% for men and 0.009% for women.

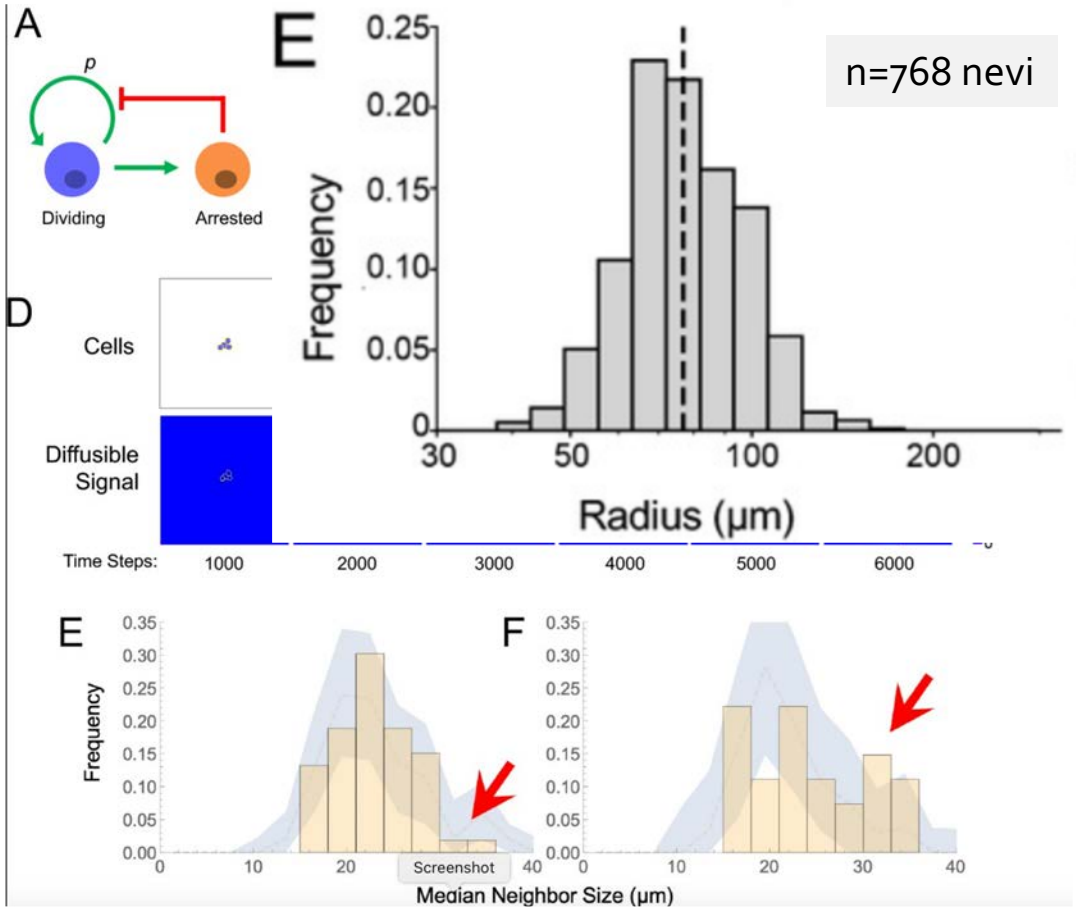
Current Model (Cell Autonomous):

- nevi melanocytes are senescent
- senescence is triggered by oncogenic mutation of Braf, ie. Oncogene Induced Senescence (OIS)



Does a collective process arrest nevi?

scRNAseq: ***no*** *OIS signatures are evident*



Mathematical simulation:
nevi growth and arrest is non-cell autonomous

"large nevi neighbors"

"small nevi neighbors"
